GTS Electronic Wireless Balancer System

GTS Equipment Co.'s new electronic wireless balancer system is easily installed on your trucks to prevent the trailer from tipping over due to uneven or moving loads.

Each day dump trucks tip over because they are not on level ground or the load shifts. Our Electronic Wireless Balancer System will help reduce the accidents in your fleet of trucks.

If there is an unlevelled condition detected, the hoist will shut down automatically ensuring that there is not an accident. You set the acceptable angle rate and this cannot be overridden by the driver once set.

The sensor is installed on the rear axle and the cab unit is installed in the cab. Since this unit ties into the trucks electrical system, there is no need for more wires running from the trailer to the cab.

Don't let this happen to your drivers!
